

LONGWAY PLANETARIUM SKY GUIDE

May
2018

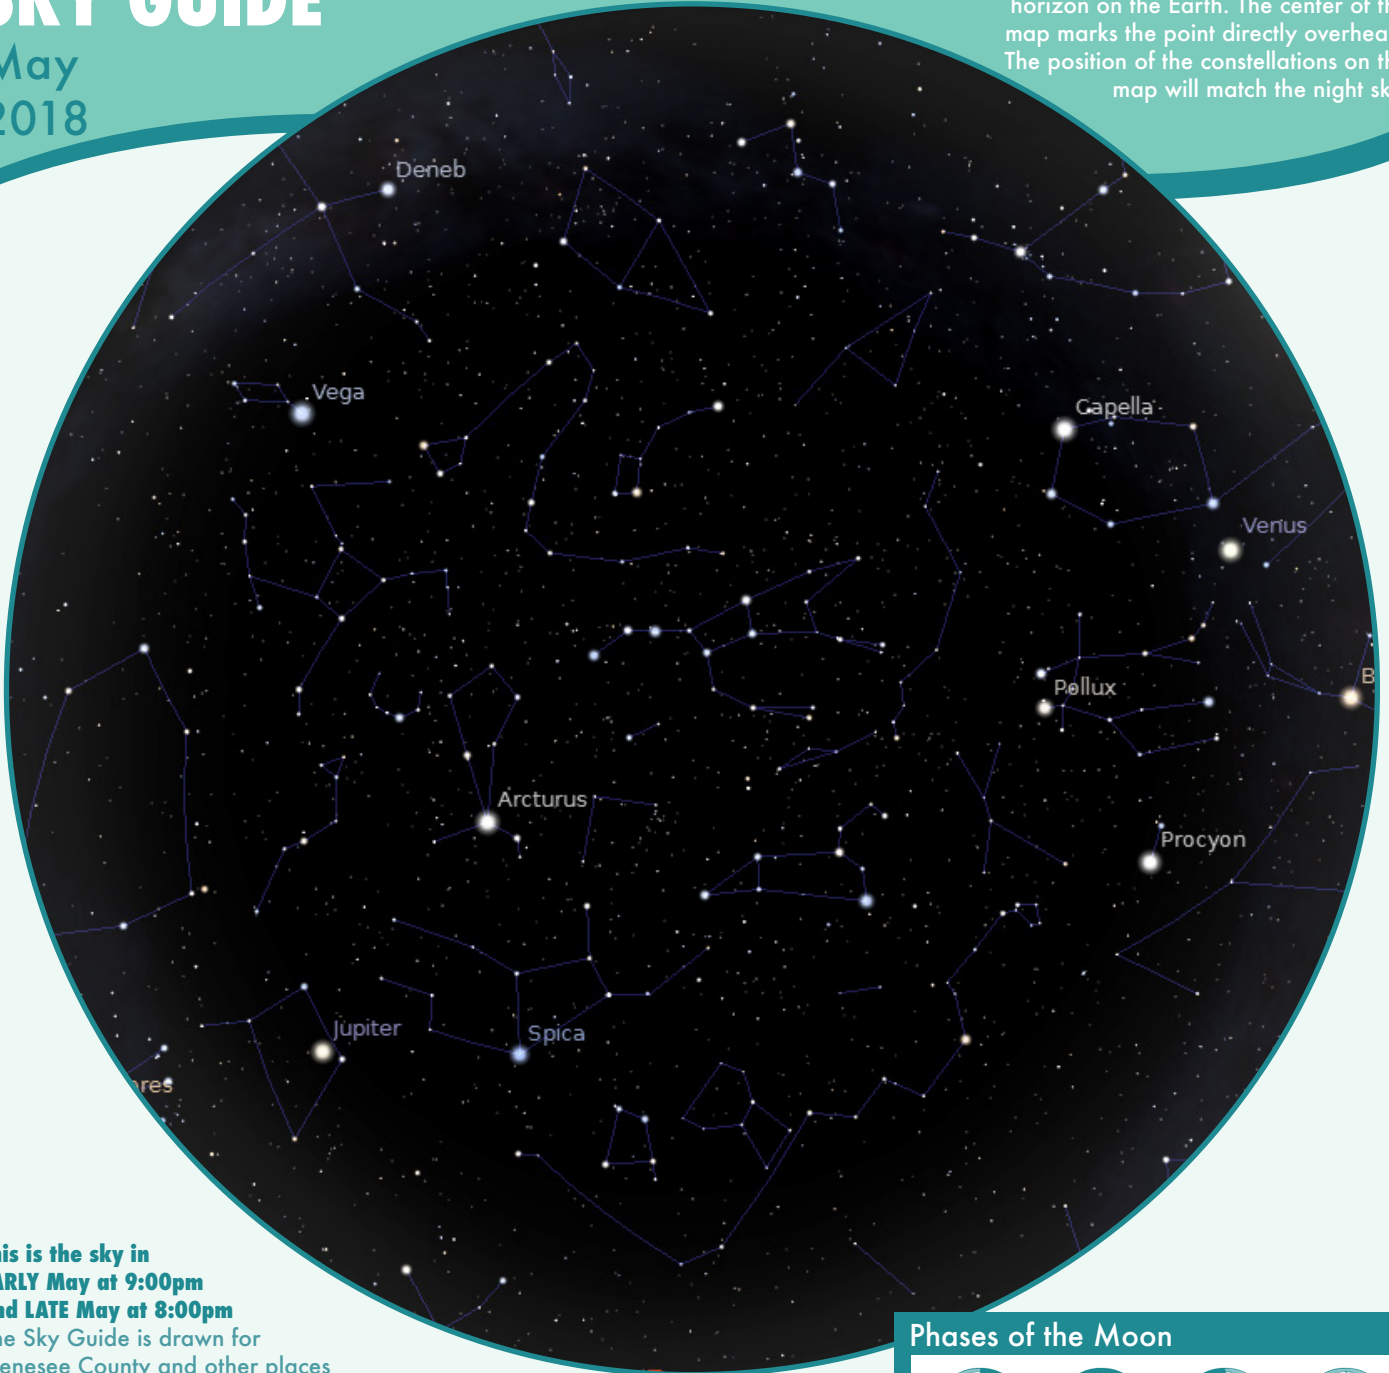

TO USE THE SKY MAP:

Hold the map over your head with "North" pointing towards the northern horizon on the Earth. The center of the map marks the point directly overhead. The position of the constellations on the map will match the night sky.

NORTH

EAST

WEST

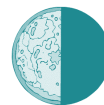

This is the sky in
EARLY May at 9:00pm
and **LATE May at 8:00pm**

The Sky Guide is drawn for
Genesee County and other places
43 degrees north latitude. Planet positions
are shown for mid-month, unless otherwise noted.

SOUTH

Phases of the Moon

3RD QUARTER
May 7th

NEW MOON
May 15th

1ST QUARTER
May 21st

FULL MOON
May 29th

VISIBLE SKY

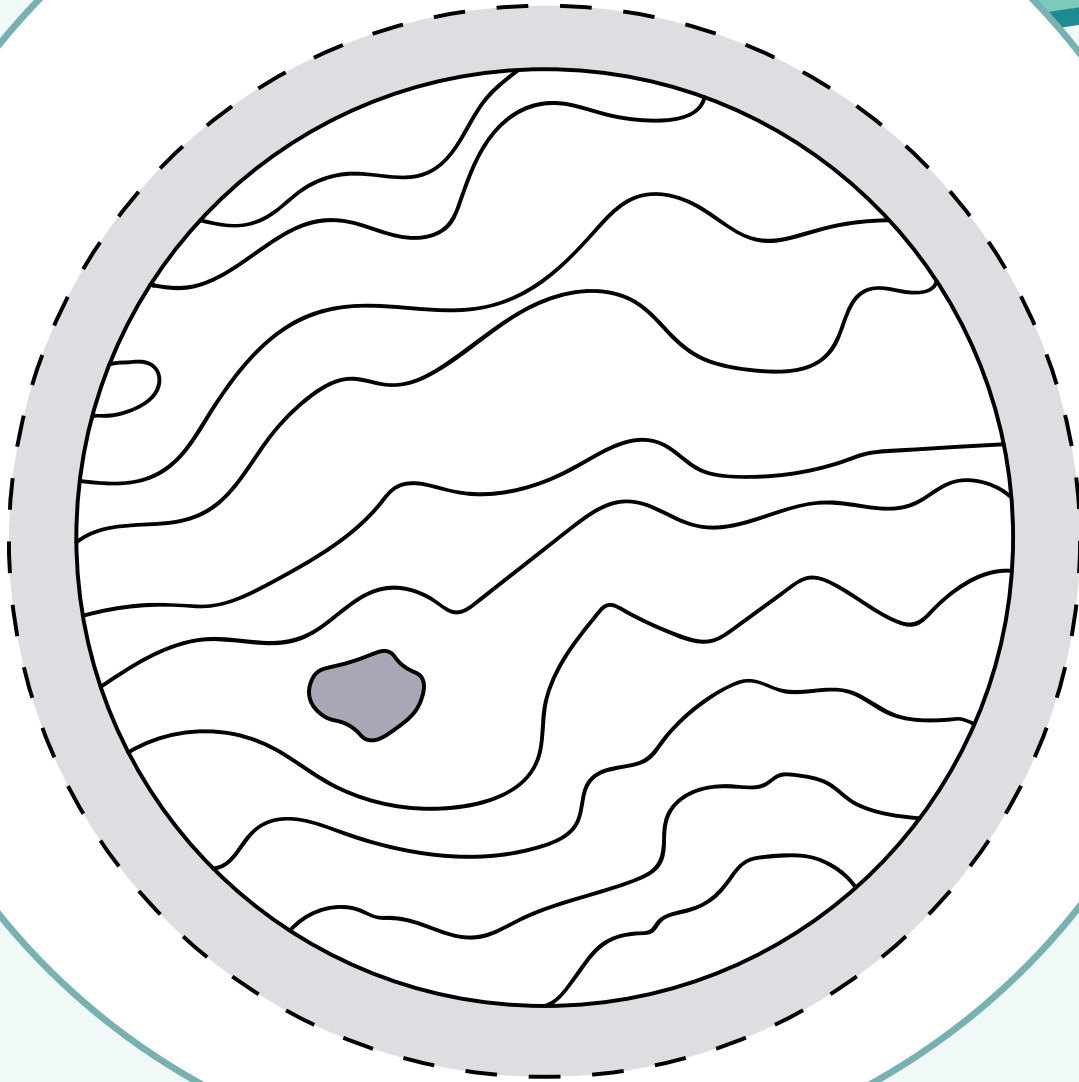

Evening Planets: Venus will be visible in the west just after sunset throughout the month of May. Views of Jupiter in the southeast will get better as the month goes on. By the end of May Jupiter will be rising before sunset and will be high enough to clear most tree lines by the time it gets dark.

Morning Planets: Saturn and Mars continue to be visible in the south morning sky throughout the month of May. Jupiter will be visible in the southwest for much of the month as well, but in the final week will begin setting as early as 5 A.M.
