Evening Planets: Saturn can be found low in the southwest throughout November. Jupiter will be visible in the southwest for the first half of the month or a little more. Toward the end of the month Venus will be swapping places with Jupiter and you will find it as the sun sets.

Morning Planets: Mars will be visible before sunrise throughout November with better views being toward the end of the month. Mercury will be visible after about the 20th depending on sky conditions. The best days to spot Mercury are between the 24th and 29th.
